### **Overview of Models Used**

# The Informetrica Model

## Sectoral Structure

- (1) Consumption =  $f$ (real personal income, relative prices, demographics)  
 Investment =  $f$ (capital stock, output, industry income, capital prices)  
 Government =  $f$ (activity)  
 Imports =  $f$ (activity, relative prices, tariff rate changes)  
 Exports =  $f$ (foreign activity, relative prices)
  - (2) Output =  $f$ (Consumption + Investment + Government + Exports - Imports)
  - (3) Labour Supply =  $f$ (income, demographics, labour market tightness)  
 Employment =  $f$ (output, capital stock)
  - (4) Labour Income =  $f$ (labour market tightness, output, capital stock, prices)  
 Capital Income =  $f$ (interest rates, capital costs and stock, foreign prices, subsidies)  
 Other Business Income =  $f$ (output, prices)
  - (5) Prices =  $f$ (foreign prices, domestic factor incomes, taxes and subsidies)
  - (6) Personal Income =  $f$ (labour income, transfers, property income)  
 Corporate Income =  $f$ (domestic and foreign capital income)  
 Government Income =  $f$ (net interest, tax revenue)  
 Foreign Income =  $f$ (personal remittances, earnings on investment)
  - (7) Interest Rates =  $f$ (foreign interest rates, relative inflation)
  - (8) Oil Production =  $f$ (exogenous assumptions)  
 Oil Demand =  $f$ (industry, household, and foreign demand)  
 Gas Production: Net Requirement. Gas Demand =  $f$ (industry, household, and foreign demand)  
 Energy Prices =  $f$ (oil prices, tax and subsidy assumptions)

## TIM DESCRIPTION

The Informetrica Model (TIM) is a large, disaggregated econometric model of the Canadian economy. The basic structure of the model follows in the tradition of several predecessor models including those of the CANDIDE family and earlier ones such as the Klein-Goldberger and Brookings models. A highly simultaneous model, TIM provides forecasts for almost 10,000 variables in four broad economic super-sectors: Final Demand, Industry Activity and Income, Sector Incomes, and the Supply Side. The key feature of TIM is the highly disaggregated final demand section. Individual estimates are available for:

- 64 categories of consumer expenditure,
- government expenditures by function, type and level,
- 75 export categories with separate equations for the U.S. and rest-of-world ,
- 83 import categories with the same directional detail,
- separate estimates for each of plant and equipment investment and capital stocks for over 60 industrial categories,
- and projections for residential construction.

This unsurpassed level of detail was made possible by the National Accounts improvements and revisions which took place between 1986 and 1988.

The final demand sector is an important channel for the resolution of impacts and for the differentiation of alternatives. Most final demand categories are explained as functions of relative prices and incomes. Thus, any factor that affects either prices or incomes will directly change the level and/or composition of final demand. One characteristic of TIM is an endogenous government expenditure section with "reaction functions" providing a linkage from the scale and composition of the economy or government revenues and/or activities, back to government expenditure on goods and services. In some policy impacts, these reaction functions are specifically exogenized to exclude an additional government response. The disaggregated specification of TIM's final demand section makes possible the detailed forecasts and impact analysis unique to Informetrica.

An input-output system translates final demand into activity (constant-dollar GDP at factor cost) for 112 industries. Estimates of employment and capital stock are used to develop a complete set of the components of factor incomes by industry. These are combined with taxes, subsidies and import prices to provide estimates of the cost of production. In turn, these domestic cost measures are combined with import prices to provide the final demand prices. Thus, any change in domestic incomes, unit labour costs or foreign prices is passed to domestic prices through the prices model. This input-output system at the core of TIM makes possible the unsurpassed industrial analysis not usually associated with macro-forecasting, but necessary for business analysis and policy formulation.

The "Business vs. Non-Business" distinction in the National Accounts industrial data is incorporated in TIM. Total income is allocated to the four major economic groups or sectors (persons and unincorporated business, governments, corporations and the foreign sector) consistent with factor incomes from production, foreign income flows, investment income by sector and government taxation and transfer programs. These incomes and the final demand prices are the major explanatory variables in the determination of final demand. Thus, one channel for the resolution of an impact is either directly or indirectly through the sector incomes and hence to final demand.

The estimates of output and the corresponding capital stocks are the key explanatory variables in the production functions which provide consistent estimates of labour demand by industry. Thus, an impact which initially affected investment would also be expected to impact labour demand. Estimates of labour demand are provided for 62 industries. For some industries, the estimates are developed in a two-step, non-linear process to reflect the appropriate adjustment from short-term influences towards the longer-term labour requirements.

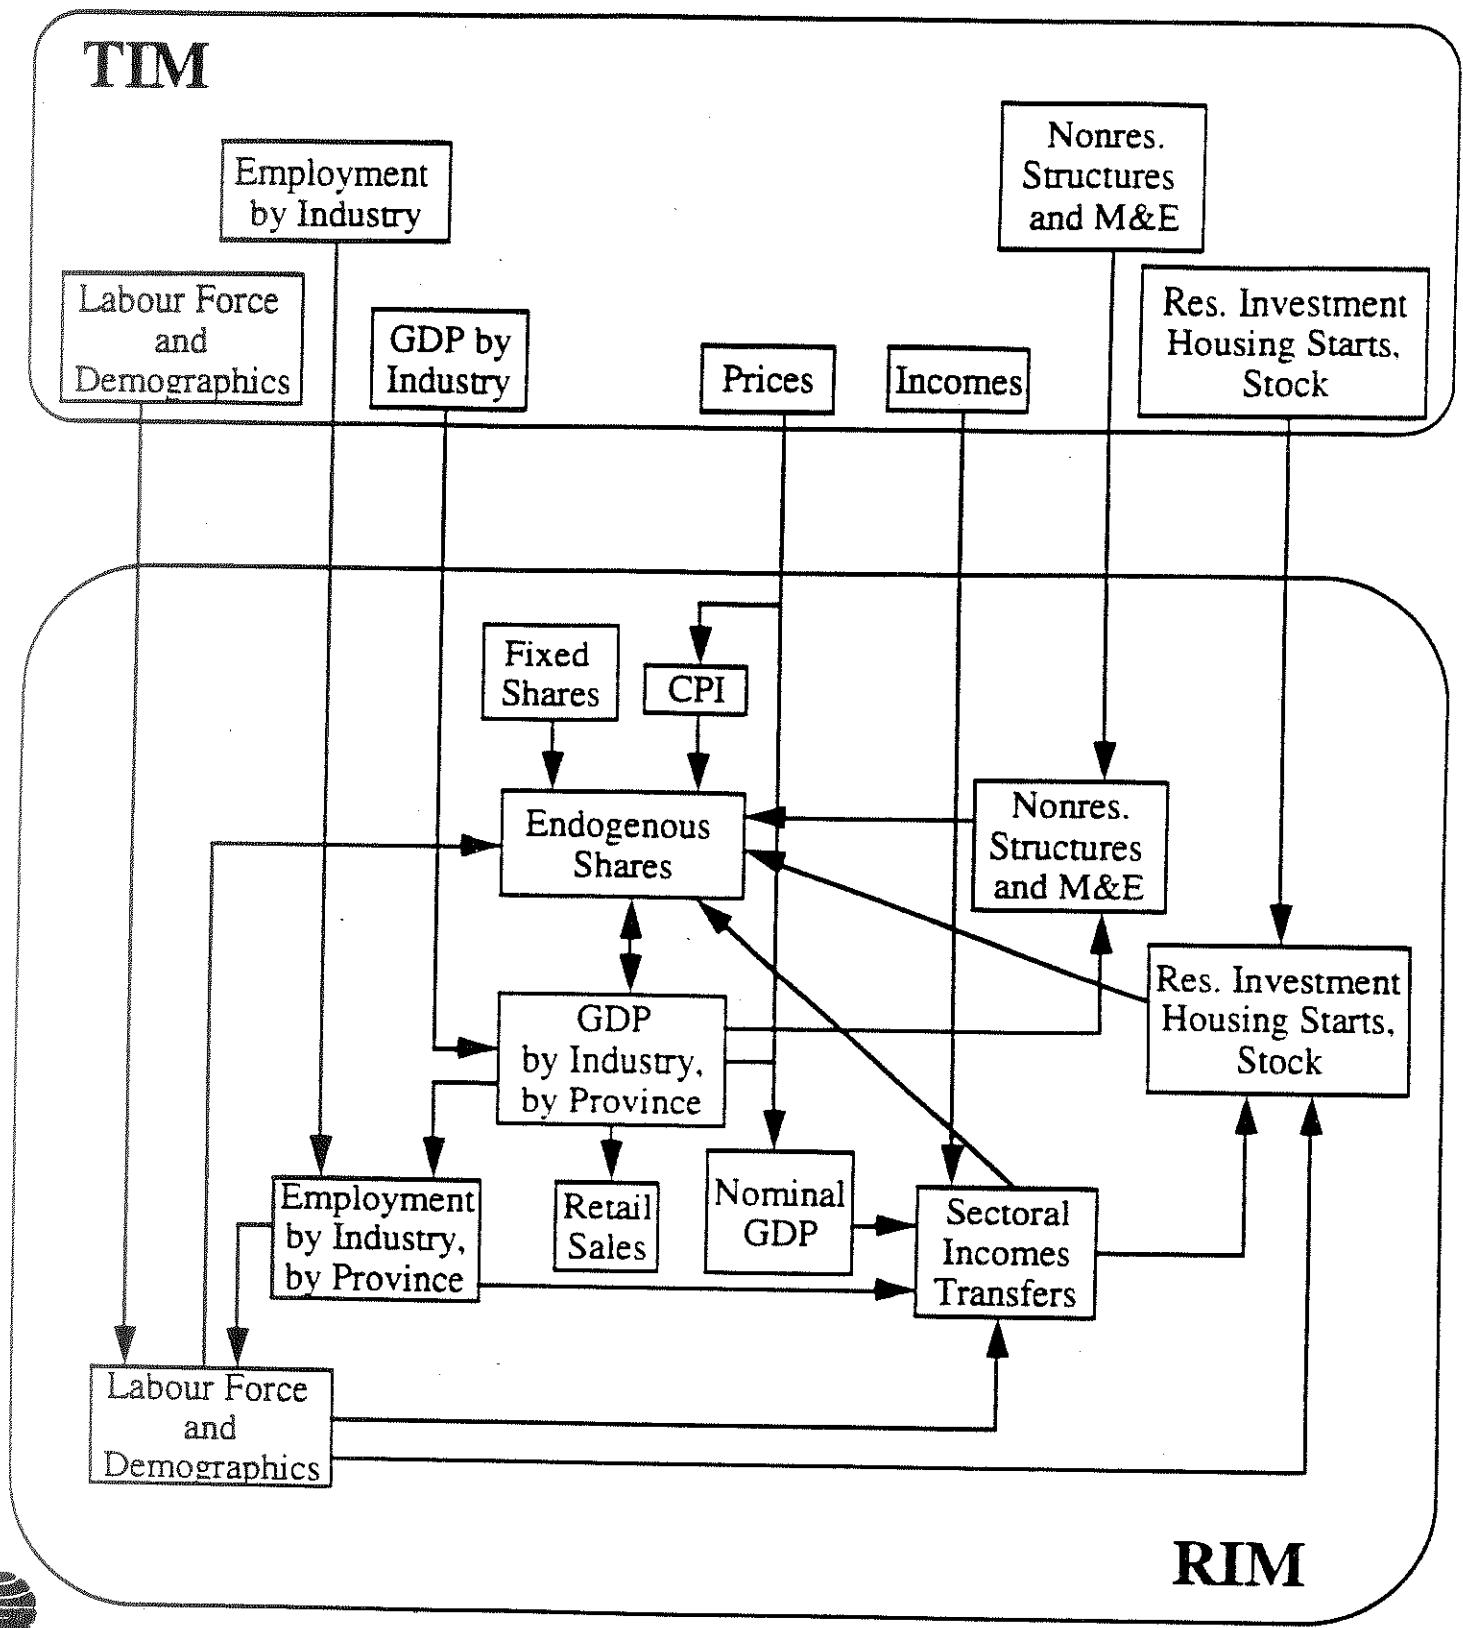

The level of factor demands, as defined by capital stock, employment and output as well as prices and interest rates, is key to the derivation of nominal industrial income (GDP) disaggregated by industry in terms of wages, unincorporated income and surplus or return to capital.

On the "supply-side", a demographic model provides endogenous labour supply and education demand estimates, and investment and discard series provide corresponding capital stock measures.

Informetrica plans to develop a sophisticated energy model to incorporate in TIM. For the time being, domestic demand for oil, gas, electricity and coal are forecast endogenously. Energy production (by province) and prices are exogenous, and either exports or imports (depending on the energy commodity) are defined residually.

# Regional-Industrial Model

## RIM DESCRIPTION

The Regional-Industrial Model (RIM), a formal "top-down" model, is used to provide the provincial dimension to the estimates of industrial activity, employment and income. Because of the availability of the sophisticated macroeconomic structure inherent in The Informetrica Model, TIM, the structure of RIM is focused directly on the regionalization of the detailed outputs from TIM. The major model flows are outlined in the RIM Flow Chart.

The initial stage is the regionalization of the TIM forecasts for industrial output - Gross Domestic Product at constant prices - for 61 industries. In general, for these impacts, the regional shares of activity for most traded goods-producing industries are unchanged from their base case values. The major exceptions to this rule are primary sector industries, such as metal mining, whose shares have been altered because of detailed final demand responses in TIM. For example, the focus in B.C. is on copper, whereas the dominant metal in Ontario is nickel. In these impacts, the relative export responses of the various metal categories in TIM is used to vary the regional shares of metal mining. For example, the variation in fertilizer exports, (e.g., potash), is the major determinant for Saskatchewan's share of non-metallic mineral output but does not directly affect the level of non-metallic mineral output in Ontario.

The assumption of stability of regional shares for other goods-producing industries, particularly manufacturing, is tenable because of the level of industrial disaggregation in RIM. For example, the differential impact of a change in interest rates on the demand for ships relative to the demand for automobiles is easily regionalized because both components of transportation equipment manufacturing are considered separately within the TIM/RIM framework.

The principal determinant of regional construction activity is, of course, residential and nonresidential investment. The national investment forecasts at the detailed industrial level are distributed to the regions using the regional estimates of constant dollar GDP as the principal explanatory variables. Estimates are provided for 14 industrial sectors for investment, discards and capital stock for both nonresidential structures and for machinery and equipment. The regional forecasts of housing starts are primarily a function of regional income, the vacancy rate and the housing stock. Estimates are provided for starts, completions and stocks for both singles and multiples for the 10 provinces.

The regional allocation of activity in the non-traded goods and services industries is determined by the regional level of households, aggregate income, GDP or some similar measure relative to the corresponding national level. For some industries, such as wholesale trade, some cross-region relationships are modelled.

The level of industrial detail in RIM reflects the uniqueness of the databases created by Informetrica to support its model development. RIM's industrial detail includes:

- Agriculture,
- Forestry,
- Fishing,
- Resource Extraction (Mining) and 6 sub-industries,
- Manufacturing, 19 major groups and 6 transportation-equipment sub-industries,
- Construction,
- Transportation Services and 7 sub-industries,
- Storage,
- Communications and 3 sub-industries,
- Utilities and 3 sub-industries,
- Commercial and Public Services and 6 sub-industries,
- Finance, Insurance and Real Estate,
- Royalties,
- Imputed Income from Owner-Occupied Dwellings, and
- Public Administration and 3 sub-industries.

Employment for 61 industries in each province is determined by relative regional productivity, national labour/output ratios and by the level of industrial output in each region. The provincial share of households is determined in the model principally as a function of that region's current and past employment share. The size of the provincial labour force is determined by the level of households or employment and the regional distribution of income.

Labour income is allocated using national income/output ratios and the regional distribution of industrial output. Nominal Gross Domestic Product is allocated provincially using national value-added prices and regional industrial output. Personal income in each province is the sum of labour income, unincorporated income and transfers from other sectors. Of the latter, UI benefits are regionalized using the relevant unemployment levels and rates. Other transfers are regionalized principally by the distribution of households or of income.

When comparing the national and regional results, it should be noted that only domestic concepts are used within the regional model. Therefore, the measure of corporate profits used excludes the impact of net foreign income flows. Similarly, the impact of a shock on Gross Domestic Product is not equivalent to that on Gross National Product because of these same flows, as well as because of the difference between a factor cost and a market price measure. Finally, the concept of labour income used in the regional model excludes military pay and allowances. However, these are included in personal income.

### The Informetrica Model - Sectoral Detail

The following tabulates the level of industry detail available in the model, and for which projections are currently made (to the year 2020) or for which the detail can be used of impact studies. A finer level of detail does exist in the model database, but projections and endogenous model reactions are limited to the following.

<u>Mnemonic</u>	<u>Description</u>
TLB	<b>Business</b>
AGR	Agriculture and related service
FSH	Fishing and trapping
FOR	Logging and forestry
RES	Mining-total extraction
RET	Mining (metals and nonmetal)
RMT	Metal mining
RMG	Gold
RMI	Iron Ore
RMO	Other
RNT	Nonmetal mining and coal
RNX	Nonmetal mining
RNA	Asbestos
RNS	Salt
RNO	Other
RNC	Coal
RPG	Crude petroleum and natural gas
RQS	Quarry and sand pit
RSV	Mining services
MAT	<b>Manufacturing</b>
MFT	Food Products, Total (Ex Bev)
MFA	Meat and Poultry Products
MFF	Fish
MFV	Fruit and vegetables
MFD	Dairy
MFG	Feed
MFX	Miscellaneous
MBV	Beverages
MBS	Soft drink
MBH	Alcoholic beverages
MTB	Tobacco
MRB	Rubber
MPL	Plastic
MLT	Leather
MXT	Primary textile and textile
MGL	Garments and Clothing
MWD	Wood
MFU	Furniture

MPT	Paper and Allied
MP1	Pulp and Paper
MP2	Paper Converters
MPR	Printing and Publishing
MPM	Primary Metal
MPF	Iron and Steel
MPN	Non-Ferrous
MPX	Smelting
MPE	Extruding, Casting
MPA	Aluminum
MPC	Copper Alloys
MPZ	Other
MMF	Metal Fabrication
MMT	Machinery
MMA	Agricultural
MMX	Non-agricultural
MTT	Transportation Equipment
MTA	Aircraft etc.
MTV	Motor Vehicles
MTC	Car and Truck Assembly
MTH	Truck and Bus Bodies
MTP	Parts and Accessories
MTZ	Railroad Rolling Stock and Miscl
MTR	Rolling Stock
MTX	Miscellaneous
MTS	Shipbuilding
MET	Electrical Equipment
MEA	Appliances
MEH	Hi tech Communications Equipment
MEC	Computers
MEB	Batteries
MEW	Wire
MEO	Other
MEX	Other Miscellaneous
MNT	Non-Metallic Minerals
MNC	Cement and Clay Products
MNG	Glass
MRP	Petroleum and Coal Refining
MCT	Chemicals
MCI	Industrial
MCO	Non-Industrial
MOT	Other Miscellaneous
CON	Construction
CRP	Repair construction
CRS	Residential construction
CST	Construction-nonresidential buildings
CRH	Highway and airstrips
CGO	Gas and oil facility
CDI	Dams and irrigation projects
CRA	Rail and telephone, telegraph
COE	Other engineering
COX	Other activity

TSP	Transportation and storage (div G)
TTT	Transportation
TTA	Air
TTR	Railway
TTW	Water
TTM	Motor and miscellaneous
TTH	Truck
TTO	Other
TTU	Urban
TTB	Interurban and Rural
TTX	Taxicabs
TTZ	Others
TTP	Pipeline
TST	Storage and warehousing
CUT	Communications and utilities
CIT	Communication
CIR	Radio TV cable
CIB	Carriers and other
CIP	Postal
UTL	Utilities
UTE	Electric power
UTG	Gas
UTO	Water and other
TRD	Trade
TRW	Wholesale
TRR	Retail
FIT	Finance, Insurance Real Estate
FIP	Personal Finance
FDT	Deposit taking
FOT	Other
FIS	Insurance
FIX	Royalties and Imputed Rent
FRY	Royalties
FHS	Imputed Rent
SVC	Community business and personal services
SVB	Business
SBO	Other business services
SBB	Professional business services
SBA	Advertising services
SED	Education
SHE	Health and social
SHS	Hospitals
SPH	Physicians and others
SAF	Accommodation and food
SVO	Other services
SRA	Recreation and amusement
SVP	Personal

TLN	<b>Non-Business</b>
REN	Mining
MAN	Manufacturing
FON	Logging and forestry
TSN	Transportation and Storage
TTG	Highway Maintenance
CIN	Communications
UTN	Utilities, Water
FIN	Finance, Insurance
SVN	Services
SBN	Business
SEN	Education
SHN	Hospitals
SHI	Health Institutions
SRN	Rec and Amusement
SPV	Private Households
SRM	Religious
SVM	Other Miscellaneous
ADT	Public Administration
ADF	Federal
ADE	Fed + Defence
AFG	Defence
ADP	Provincial
ADL	Local

For each of the industry categories detailed above, there are a large number of economic attributes endogenously determined. They include:

#### **Measures of Output and other Supply-side Indicators**

Gross Output, in constant and nominal dollars

Value Added, or Gross Domestic Product, in constant and current dollars

Investment in Machinery and Equipment in constant and nominal dollars

Investment in Structures in constant and nominal dollars

Capital Stock of Machinery and Equipment in constant dollars

Capital Stock of Structures in constant dollars

Scrapage of Machinery and Equipment Capital Stock in constant dollars

Scrapage of Structures in constant dollars

#### **Measures of Prices and Incomes**

Industry Return to Capital

Unincorporated Income

Unit Capital Costs

Rental costs of Capital

Gross Output and Value Added Prices

#### **Measures of Taxes**

Commodity Taxes

Corporate Taxes

**Informetrica**  
Limited

## **Subsidies**

### **Employment**

Employment on an establishment and labour force survey basis; that is there is a balanced production function for each of the industries since output, capital stock and employment are defined for each. The input-output system provides material input (and technology) information.

### **Wages**

Supplementary Labour Costs, which are composed of a large number of components, including Unemployment insurance payments, contributions to pension plans and workers compensation, etc.

### **Links Between Demand and Supply**

The demand side of the economy is decomposed, again at a high level of detail for each of the following groupings. These are conventional measures of Final Demand, including personal consumption, residential expenditures, exports and imports, government expenditures, inventories, and as noted above, industry investment. The foreign trade variables are further decomposed as between trade with the United States, and with the Rest-of-the-World so that unilateral, continental and global impact studies can be distinguished. Again, all of these are available in constant and current dollar terms.

Some of these expenditure categories (and their stocks), or production and capital stock categories are currently used for direct linkage to emission considerations, as for example, when considering emissions from the stock of personally owned vehicles, or emissions of NOX, SOX, CO<sub>2</sub>, etc. to activity in relevant emitting sectors.

Expenditure categories are linked, for constant dollar indicators and the prices sub-model to the industries through the Large level input-output tables. In addition, a single-year, by gender, population model is used so that emissions that are person, or household based, can be linked in a specific fashion.

### **Provincial Detail**

A Regional-Industrial Model provides estimates for industries for each of Canada's provinces, and the two Territories, where the sum of provincial variables is equal to national totals. The sector detail is slightly smaller (121 industries for each province as compared to 159 for the national economy), but is the most highly disaggregated detail available in any modelling framework.

For each industry, output and employment is determined. The model incorporates an export-base view of industry spatial allocation, with such spatial allocation of goods-producing sectors determined by

detail on final demand available from the national model, and provincial service sector production determined endogenously within the Regional-Industrial model based on activity in the export-base sectors of the province and those nearby, and on population variables.

Labour supply at the provincial level is determined by activity within the province, and through internal migration of the population between provinces.
