Forecast Highlights (2016 – 2036)

Since its deregulation in 1978, the U.S. commercial air carrier industry has been characterized by boom-to-bust cycles. The volatility that was associated with these cycles was thought by many to be a structural feature of an industry that was capital intensive but cash poor. However the great recession of 2007-09 marked a fundamental change in the operations and finances of U.S Airlines. Air carriers fine-tuned their business models to minimize losses by lowering operating costs, eliminating unprofitable routes, and grounding older, less fuel efficient aircraft. To increase operating revenues, carriers initiated new services that customers were willing to purchase and started charging separately for services that were historically bundled in the price of a The industry experienced an unprecedented period of consolidation with four major mergers in five years. These changes along with capacity discipline exhibited by carriers have resulted in a fifth consecutive year of profitability for the industry in 2015. Looking ahead there is optimism that the industry has been transformed from that of a boom-to-bust cycle to one of sustainable profits.

As the economy recovers from the most serious economic downturn since World War II and the slowest expansion in recent history, aviation will continue to grow over the long run. Fundamentally, over the medium and long term, demand for aviation is driven by economic activity. The 2016 FAA forecast calls for U.S. carrier passenger growth over the next 20 years to average 2.1 percent per year, slightly faster than last year's forecast. The sharp decline in the price of oil in 2015 is a catalyst for a short lived uptick in

passenger growth in 2016. Although oil prices are projected to fall to around \$43 per barrel in 2016, our forecast assumes that they will rise thereafter to exceed \$100 by 2023 and \$150 by the end of the forecast, keeping a lid on U.S. economic growth during the same period. There are a number of headwinds that are buffeting the global economy - the fall in oil prices, recession in Russia and Brazil and inconsistent performance in other emerging economies, a "hard landing" in China, and lack of further stimulus in the advanced economies. The uncertainty over the future course of oil prices is just one more item on the list. Although the U.S. economy has managed to avoid a recession, a prolonged period of faster economic growth (e.g. > 3%) may not be forthcoming.

System traffic in revenue passenger miles (RPMs) is projected to increase by 2.6 percent a year between 2016 and 2036. Domestic RPMs are forecast to grow 2.1 percent a year while International RPMs are forecast to grow almost twice as fast at 3.5 percent a year. U.S. carrier system capacity measure in available seat miles (ASMs) is forecast to grow in line with the increases in demand. The number of seats per aircraft is getting bigger, especially in the regional jet market, where we expect the number of 50 seat regional jets to fall to just a handful by 2023, replaced by 70-90 seat aircraft.

Although the U.S. and global economy continued to sputter in 2015, stable demand and lower energy prices resulted in record profits for U.S. airlines. U.S. carrier profitability should remain steady or increase as the recovery leads to strengthening demand

and increased revenues, while lower energy prices keep operating costs in check. Over the long term, we see a competitive and profitable aviation industry characterized by increasing demand for air travel and airfares growing more slowly than inflation, reflecting over the long term a growing U.S. economy.

The long term outlook for general aviation is favorable, led by gains in turbine aircraft activity. The active general aviation fleet is forecast to increase 0.2 percent a year between 2015 and 2036, equating to an absolute increase in the fleet of about 7,000 units. While steady growth in both GDP and corporate profits results in continued growth of the turbine and rotorcraft fleets, the largest segment of the fleet – fixed wing piston aircraft continues to shrink over the forecast. Although fleet growth is minimal, the number of general aviation hours flown is projected to increase an average of 1.2 percent per year through 2036, as growth in

turbine, rotorcraft, and experimental hours more than offset a decline in fixed wing piston hours.

With increasing numbers of regional and business jets in the nation's skies, fleet mix changes, and carriers consolidating operations in their large hubs, we expect increased activity growth which has the potential to increase controller workload. Operations at FAA and contract towers are forecast to increase 0.9 percent a year over the forecast period with commercial activity growing at five times the rate of noncommercial activity. The growth in U.S. airline and business aviation activity is the primary driver. Large and medium hubs will see much faster increases than small and non-hub airports, largely due to the commercial nature of their operations.

Review of 2015

Despite slow economic growth at home and abroad, 2015 was a pretty good year for U.S. aviation. Stable demand, falling yields, and falling costs added up to a year of record profits for the U.S. airline industry. The shift in focus from market share to boosting returns on invested capital has resulted in something the industry has rarely seen sustained profitability. The U.S. airline industry has become more nimble in adjusting capacity to seize opportunities or minimize losses. U.S. airlines continue to refine strategies for developing additional revenue streams such as charging fees for services that used to be included in airfare (e.g. meal service), as well as for charging for services that were not previously available (e.g. premium boarding and fare lock fees). The impact from these initiatives gives reason for optimism as the industry (passenger and cargo carriers combined) posted profits for the sixth consecutive year in 2015.

Demand for air travel in 2015 grew at the fastest pace since 2007 despite modest economic growth in the U.S. In 2015 system revenue passenger miles (RPMs) increased 3.8 percent as enplanements increased at the same rate. Domestic RPMs were up 4.8 percent while enplanements were up by 4.2 percent. International RPMs increased by just 2.2 percent as enplanements, negatively impacted by the slowdown in China, recession in Brazil and Russia, and exchange rate fluctuations, increased only 1.6 percent. The system-wide load factor fell 0.1 points to 83.3 percent.

Yields fell for the first time in five years. In domestic markets, falling oil prices and rapid expansion by ultra-low cost carriers such as Spirit and Allegiant led to a 1.6 percent decline. International yield fell 4.8 percent, impacted by weak demand and currency fluctuations. Despite falling yields U.S. airlines posted record profits in FY 2015 as falling energy prices more than offset revenue weakness from falling yields. Data for FY 2015 show that the reporting passenger carriers had a combined operating profit of \$24.1 billion (compared to a \$14.9 billion operating profit for FY 2014). The network carriers reported combined operating profits of \$17.3 billion while the low cost carriers reported combined operating profits of \$6.0 billion, with all carriers posting profits.

The general aviation market showed continuing improvements in single engine piston and business jet segments, while declines in turboprop and multi-engine piston segments translated into a downturn in shipments. Overall deliveries were down by 3.1 percent in calendar year (CY) 2015; even though U.S. billings increased 2.4 percent to \$12.0 billion. General aviation activity at FAA and contract tower airports recorded a 0.3 percent decline in 2015 as itinerant activity fell 0.7 percent, more than offsetting a 0.1 percent increase in local operations.

Total operations at FAA and contract towers rose in 2015 by 0.2 percent, the first increase in activity since 2007. Air carrier activity increased by 5.7 percent, more than offsetting declines in the air taxi, general aviation, and military categories. Activity at large hubs rose by 0.7 percent, while medium hub activity increased by 0.6 percent. Small/non-hub airport activity was flat in 2015 compared to the prior year.

FAA Aerospace Forecasts Fiscal Years 2016-2036

Economic Environment

In the near term, IHS Global Insight projects that world economic growth will remain subpar, below 3% a year for the next two years. While growth remains sluggish to steady for the United States and Europe, the rest of the world is struggling and will continue to do so. In the United States, consumer spending is solid, fueled by lower oil prices and steady job growth while in 2015 Europe saw its best performance since 2011 as central bank stimulus and low oil and commodity prices provided the basis for growth. Japan's economy contracted in late 2015 and shows few signs of robust recovery any

time soon. In emerging markets, China is moving into a period of slower growth as 2015 was the slowest year since 1990 as the economy begins the transition from an export and manufacturing based economy to one that is more oriented towards the service and technology sectors. In 2015 real GDP in India grew an impressive 7.5% but was lacking balance as exports and investment led while private consumption lagged. Other emerging markets such as Brazil and Russia were in recession in 2015 and are not expected to see growth until 2017.

India and China led World Economic Growth in 2015

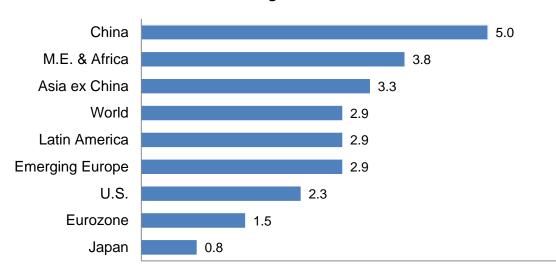

Source: IHS Global Insight

IHS Global Insight forecasts world real GDP to grow at 2.9 percent a year between 2016 and 2036. Emerging markets are forecast to grow above the global average but at lower rates than in the early 2000's. Asia (excluding Japan), led by India and China, is projected to have the fastest growth followed by Middle East and Africa, Latin

America, and Eastern Europe. Growth in the more mature economies will be lower than the global trend with the fastest rates in the U.S. followed by Europe. Growth in Japan is projected to be very slow with rates below 1% a year reflecting deep structural issues associated with a shrinking and aging population.

Asia and Africa/Middle East lead global economic growth

Oil prices fell by 42% in 2015 to around \$57 per barrel and are projected to fall another 24% in 2016 to \$43 per barrel. However, the long run trend in oil prices is upward due to growing demand and higher costs of ex-

traction, and IHS Global Insight forecasts the price of oil to reach \$100 per barrel by 2023 and continue to rise modestly thereafter to \$152 by 2036.

U.S. Airlines

Domestic Market

Mainline and regional carriers¹ offer domestic and international passenger service between the U.S. and foreign destinations, although regional carrier international service is confined to the border markets in Canada, Mexico, and the Caribbean. Twenty-nine all-cargo carriers were providing domestic and/or international air cargo service at the end of 2015.

Shaping today's commercial air carrier industry are three distinct trends: (1) industry consolidation and restructuring; (2) continued capacity discipline in response to external shocks, and (3) the proliferation of ancillary revenues.

The restructuring and consolidation of the U.S. airline industry that began in the aftermath of the terror attacks of September 11, 2011 continued in 2015. American and US Airways combined their networks and reservations systems to form the world's largest airline with the last U.S. Airways flight occurring in October 2015. Consequently, there are now only four dominant airlines in the U.S. – American, Delta, Southwest, and United – controlling approximately 76% of the domestic market. It is highly unlikely the U.S. Government will approve any further mergers among these four due to anti-trust

regulations. In 2005 there were twelve major mainline airlines.

The mergers and increasing market presence of low cost carriers like Frontier, Jet-Blue and Southwest have had clear implications on the fares, size of the aircraft being used and the load factors, topics that will be discussed later in this document.

One of the most striking outcomes of industry restructuring has been the unprecedented period of capacity discipline, especially in domestic markets. Between 1978 and 2000, ASMs in domestic markets increased at an average annual rate of 4 percent a year, recording only two years of decline. Even though domestic ASMs shrank by 6.9 percent in FY 2002, following the events of September 11, 2001, growth resumed and by 2007, domestic ASMs were 3.6 percent above the FY 2000 level. However, U.S. domestic ASMS are still down 1.2 percent when compared to 2007 as the industry responded first to the sharp rise in oil prices (up 155% between 2004 and 2008) and then the global recession that followed (2009 to the present). 2015 is the first year showing strong growth in ASMs (4.6 percent) since 2004.

The reduction in domestic capacity since 2007 has not been shared equally between the mainline carriers and their regional counterparts. To better match demand to capacity, the mainline carriers contracted out "thin" routes to their regional counterparts because they could provide lift at a lower cost, or else they simply removed the capacity altogether. In 2015, the mainline carrier group provided 0.9 percent less ca-

9

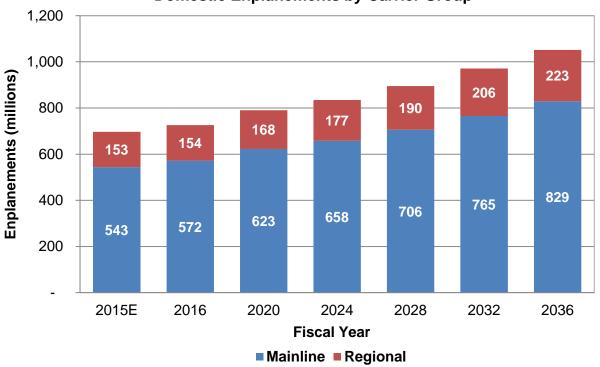

¹ Mainline carriers are defined as those providing service primarily via aircraft with 90 or more seats. Regionals are defined as those providing service primarily via aircraft with 89 or less seats and whose routes serve mainly as feeders to the mainline carriers.

pacity than it did in 2007 (but carried 2.1 percent more passengers thus load factors increased). Capacity flown by the regional group has shrunk by 3.0 percent over the same period (with passengers carried down 2.1 percent).

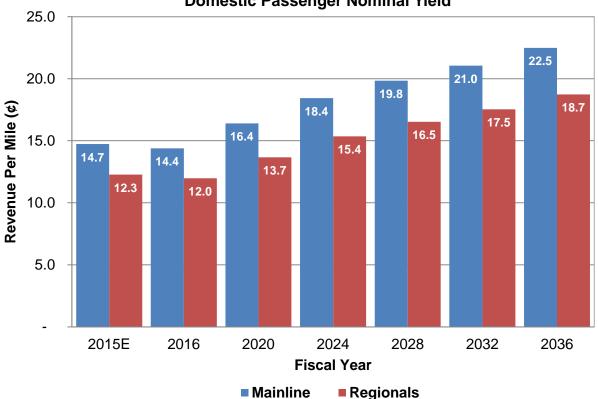

The regional market has continued to shrink as the regionals compete for even fewer contracts with the remaining dominant carriers; this has meant slow growth in enplanements and yields.

U.S. Commercial Air Carriers

Domestic Enplanements by Carrier Group

The regionals have less leverage with the mainline carriers than they have had in the past as the mainline carriers have negotiated contracts that are more favorable for their operational and financial bottom lines. Furthermore, the regional airlines are facing large pilot shortages and tighter regulations regarding pilot training. Their capital costs have increased in the short-term as they continue to replace their 50 seat regional jets with more fuel efficient 70 seat jets. This move to the larger aircraft will prove beneficial in the future however since their unit costs are lower.

Another continuing trend is that of ancillary revenues. Carriers generate ancillary revenues by selling products and services beyond that of an airplane ticket to customers.

This includes the un-bundling of services previously included in the ticket price such as checked bags and on-board meals, and by adding new services such as boarding priority and internet access. As noted earlier, U.S. passenger carriers posted record net profits for the sixth consecutive year in 2015 with ancillary revenues a contributing factor to the favorable outcome as well as very low oil prices. Airlines are also increasingly experimenting with segmenting their cabins into more discreet cost categories based on comfort amenities like seat pitch, leg room, and access to social media and outlets.

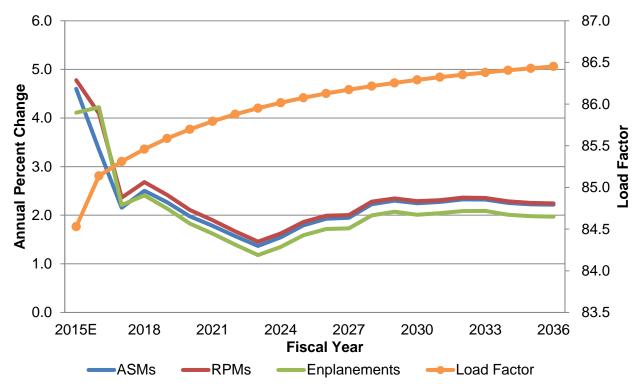

U.S. commercial air carriers' total number of domestic departures continued the downward trend that started in 2008 while ASMs.

RPMs and enplanements all showed a rebound; these trends underlie the expanding size of aircraft and higher load factors. In 2015, the domestic load factor reached a historic high of 84.5 for commercial air carriers. It is presently assumed that the load factor will not exceed 86.5 in the future due to the logistical difficulties inherent in matching supply perfectly with demand.

_

² Commercial airlines encompass both mainline and regional carriers.

System, that is, the sum of domestic plus international capacity, increased 3.9 percent to 1.066 trillion ASMs in 2015 while RPMs increased 3.8 percent to 889.1 billion. During the same period system-wide enplanements increased 3.8 percent to 785.8 million. In 2015, U.S. carriers prioritized the domestic over the international market in terms of allocating capacity. It is forecast that this allocation will continue into 2016 but carriers will start expanding capacity in the international market starting in 2017 and remain focused on that growth market through 2036 as the domestic market continues to mature.

U.S. mainline carrier enplanement growth in the combined domestic and international market was 5.1 percent in 2015 while regional carriers carried 1.1 percent fewer passengers.

In the domestic market, mainline enplanements saw an increase for the fifth consecutive year, up 5.6 percent, marking the first time since 2000 that the industry recorded five consecutive years of passenger growth in the domestic market. Mainline passengers in international markets posted a sixth year of growth, up 2.4 percent.

Even though the recession was officially over in June 2009, carriers continued to face demand uncertainty in 2015 as wages continued to stagnate, household income growth was weak, the housing market's recovery was patchy across the country, and government spending at the federal and local levels remained stagnant and are pro-

jected to remain so for the next few years. Despite these dire statistics, the unemployment rate fell and consumer spending was up and many urban housing markets have been revived strongly. In such an uneven, but slowly improving, environment, industry capacity growth was restrained (up 3.9 percent), after only a 2.3 percent increase in 2014. Higher airfares and ancillary revenues, coupled with falling fuel prices result-

ed in U.S. carriers finishing up 2015 with a strong net profit.

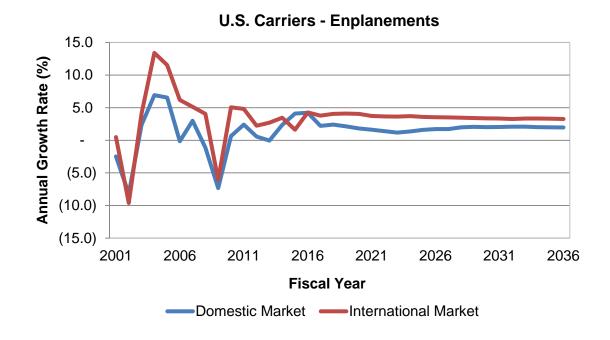

System load factor and trip length remained flat in 2015, even as seats per aircraft mile increased by 2.4 percent; again reflecting the trend towards using larger aircraft. Seats per aircraft mile system wide increased to 149.1 seats (up 3.5 seats per aircraft mile), the highest level since 1994.

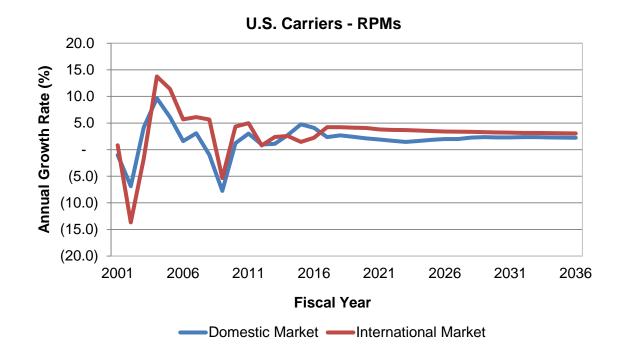

International Market

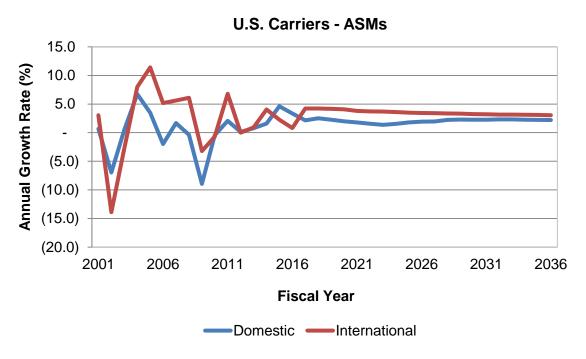

The international market continues to be the growth segment for U.S. carriers when compared to the mature U.S. domestic market, especially since FY 2004. Last year, 2015, was an exception to the trend and 2016 is expected to follow suit as airlines continue to focus on the domestic market. Starting in 2017 the international market (comprised of mainline and regional carriers) should again start outpacing the domestic market in terms of enplanements,

RPMs and ASMs at an average annual rate (FY 2017-2036) of 3.6%, 3.5%, and 3.5% respectively.

While the financial situation across the world has weakened somewhat, lower fares enabled by falling oil prices and more efficient aircraft has boosted demand; at least in the short term. It is possible that historically low oil prices signal further weakening in the global economy and thus, lower travel demand in the future.

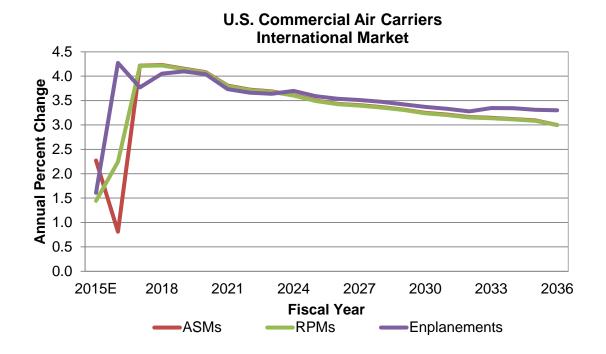

The next five years will feature a rebuilding of international demand by the U.S. carriers with moderate growth averaging around 3.6, 3.5, and 3.5 for enplanements, RPMs, and ASMs respectively. Airlines will exercise

capacity restraint and the load factor is expected to stabilize around 81.8%. Load factors this high were last seen in 2013.

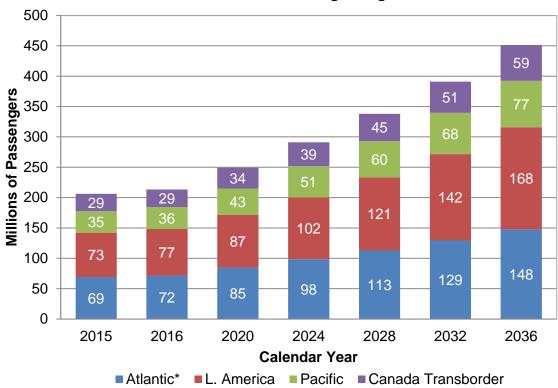

Overall however, U.S. carrier market share of international passengers has been dropping in all regions with the exception of the Caribbean, Oceania and Central America. It is expected that these trends will continue.

U.S. Carrier Enplanement Market Share by Region 100% Caribbean 90% Mexico 80% —Central America % of Market Share 70% South America All Countries 60% —Canada 50% Africa 40% Europe -Asia 30% Oceania -20% Middle East 10% 2011 2012 2013 2015 2014 Calendar Year

17

Total Passengers To/From the U.S. American and Foreign Flag Carriers

Source: US Customs & Border Protection data processed and released by Department of Commerce; data also received from Transport Canada

For U.S. carriers, Latin America is still the largest international destination despite the recent economic and political crises of Brazil. While 2014 saw 7.5% growth, 2015 still showed a very robust 5.1% increase. In contrast, the Pacific region saw 0% enplanement growth and the Atlantic region saw a drop of 1.3%. It is expected that the Latin American market will continue to be the growth market for travel to and from the U.S.

Despite the economic powerhouses of China, Japan and South Korea, the Pacific region remains a relatively small market for the U.S. and will remain so for the next twenty years. While travel to the US will

grow approximately 3.8% per year from 2016-2036 for all carriers, the majority of travel demand in that region will be intra-Asian.

Both the Atlantic and Canada regions are mature and will experience enplanement growth of 3.7% and 3.6%, respectively, on average over the twenty year period for all carriers. It is unclear at this time if the Syrian refugee crisis and terrorism threats will affect travel demand in 2016 and beyond.

Despite the recent economic downturn in Latin America, it is still the largest driver of international demand to the U.S. Mexico, the most popular destination, is forecast to

^{*} Per past practice, the Mid-East region and Africa are included in the Atlantic category.

experience 4.2% annual growth from 2016-2036 for all carriers whereas the entire region is forecast to grow 4.0%

Cargo

Air cargo traffic contains both domestic and international freight/express and mail. The demand for air cargo is a derived demand resulting from economic activity. Cargo moves in the bellies of passenger aircraft and in dedicated all-cargo aircraft on both scheduled and nonscheduled service. Cargo carriers face price competition from alternative shipping modes such as trucks, container ships, and rail cars.

U.S. air carriers flew 35.9 billion revenue ton miles (RTMs) in 2015, up 2.2 percent from 2014 with domestic cargo revenue ton miles (RTMs) increasing 3.3 percent to 13.1 billion while international RTMs increased by 1.6 percent to 22.9 billion. Air cargo RTMs flown by all-cargo carriers comprised 78.1 percent of total RTMs in 2015, with passenger carriers flying the remainder. Total RTMs flown by the all-cargo carriers increased 1.8 percent in 2015 while total RTMs flown by passenger carriers grew by 3.6 percent.

U.S. carrier international air cargo traffic can be divided into four components consisting of Atlantic, Latin, Pacific, and 'Other International.' In 2015 total international RTMs increased 1.6 percent to 22.9 billion as growth in the Pacific region offset declines in the other three regions.

Historically, air cargo activity tracks with GDP. Additional factors that affect air cargo growth are fuel price volatility, movement of real yields, and globalization. Significant structural changes have occurred in the air cargo industry; among these are air cargo security regulations by the FAA and TSA, maturation of the domestic express market,

a shift from air to other modes (especially truck), use of all-cargo carriers (e.g., FedEx) by the U.S. Postal Service to transport mail, and the increased use of mail substitutes (e.g. e-mail, cloud-based services).

The forecasts of Revenue Ton Miles (RTMs) are based on several assumptions specific to the cargo industry. First, security restrictions on air cargo transportation will remain in place. Second, most of the shift from air to ground transportation has occurred. Finally, long-term cargo activity will be tied to economic growth.

The forecasts of RTMs were based on models that link cargo activity to GDP. Forecasts of domestic cargo RTMs were developed with real U.S. GDP as the primary driver. Projections of international cargo RTMs were based on growth in world GDP, adjusted for inflation. The distribution of RTMs between passenger and all-cargo carriers was forecast based on an analysis of historic trends in shares, changes in industry structure, and market assumptions.

After increasing by 2.2 percent in 2015, total RTMs are forecast to grow 4.5 percent in 2016 and driven by steady U.S. and world economic growth, total RTMs are projected to increase at an average annual rate of 3.5 percent for the balance of the forecast period.

Domestic cargo RTMs are forecast to grow 1.9 percent in 2016 as the U.S. economic recovery continues after posting a 3.3 increase in 2015. Between 2016 and 2036, domestic cargo RTMs are forecast to increase at an average annual rate of 0.4

percent. In 2015, all-cargo carriers carried 89.2 percent of domestic cargo RTMs. The all-cargo share is forecast to grow to 90.8 percent by 2036 based on increases in capacity for all-cargo carriers and ongoing security considerations.

International cargo RTMs grew 1.6 percent in 2015 after posting a 0.3 percent increase in 2014 as stagnation in Europe and a slowdown in China's economic growth slowed worldwide trade. Growth is expected to rebound in 2016 to 6.0 percent as global trade growth resumes. For the forecast period (2016-36) international cargo RTMs are forecast to increase an average

of 4.7 percent a year based on projected growth in world GDP with the Pacific region having the fastest growth, followed by the Other International, Atlantic, and Latin regions, respectively.

The share of international cargo RTMs flown by all-cargo carriers increased from 49.3 percent in 2000 to 71.8 percent in 2015. Continuing the trend experienced over the past decade, the all-cargo share of international RTMs flown is forecast to increase modestly to 78.1 percent by 2036.

General Aviation

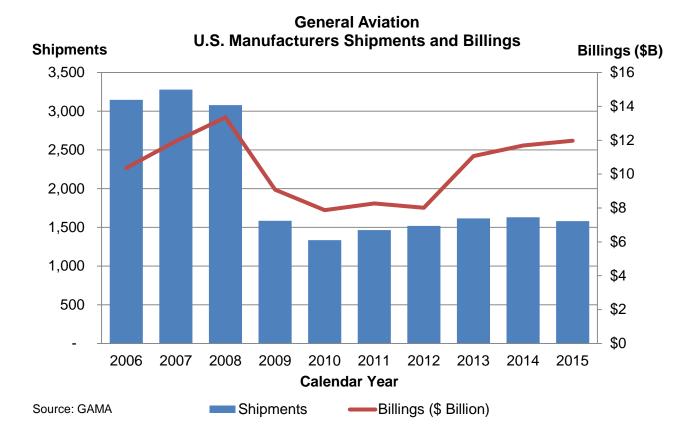

The FAA uses estimates of fleet size, hours flown, and utilization rates from the General Aviation and Part 135 Activity Survey (GA Survey) as baseline figures to forecast the GA fleet and activity. Forecasts of new aircraft deliveries, which use the data from General Aviation Manufacturers Association (GAMA), together with assumptions of retirement rates, produce growth rates of the fleet by aircraft categories, which are applied to the GA Survey fleet estimates. The forecasts are carried out for "active aircraft." not total aircraft. The FAA's general aviation forecasts also rely on discussions with the industry experts conducted at industry meetings, including four Transportation Research Board (TRB) meetings of Business Aviation and Civil Helicopter Subcommittees conducted annually in May and January.

The results of the 2014 GA Survey, the latest available, were consistent with the results of surveys conducted since 2004 improvements to the survey methodology. The 2014 Survey recorded the first increase to the GA fleet since 2007, particularly since the implementation of 2010 Rule for Re-Registration and Renewal of Aircraft Registration. The active GA fleet was estimated as 204,408 aircraft in 2014 (up 2.2 percent from 2013), with 23.3 million hours flown (up 1.7 percent from 2013).

In 2015, the general aviation industry experienced its first decline in deliveries since

2010. While the single engine piston aircraft deliveries by U.S. manufacturers continued to grow and business jet deliveries recorded a very modest increase compared to the previous year, turboprop deliveries were down by 10 percent, and much smaller category of multi-engine piston deliveries declined 40 percent. Based on figures released by GAMA, U.S. manufacturers of general aviation aircraft delivered 1,581 aircraft in CY 2015, 3.1 percent fewer than CY 2014. This was the first decline after four vears of growth in shipments that showed first signs of slowing down in 2014. Single engine piston deliveries increased by 3.4 percent in 2015, but the decrease in multiengine piston shipments caused a 0.6 percent decrease in overall piston airplane deliveries. In the turbine categories, turbojet deliveries were up by 0.8 percent. With the 10.0 percent decline in turboprop deliveries, total turbine shipments went down by 5.3 percent in 2015.

³ An active aircraft is one that flies at least one hour during the year.

GAMA and industry experts also reported significant decreases in rotorcraft deliveries in 2015, particularly resulting from direct and indirect effects of oil price declines.

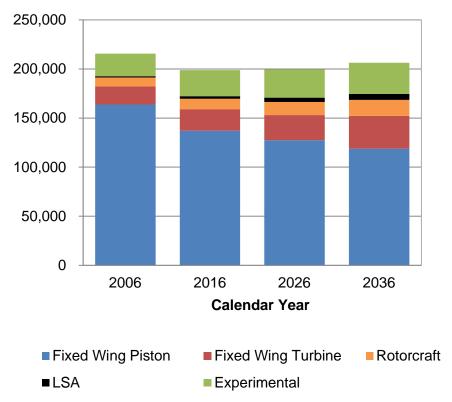

Against these current conditions, the long term outlook for general aviation, driven by turbine aircraft activity, remains favorable. The active general aviation fleet is projected to increase at an average annual rate of 0.2 percent over the 21-year forecast period, growing from an estimated 203,880 in 2015 to 210,695 aircraft by 2036. The more expensive and sophisticated turbine-powered fleet (including rotorcraft) is projected to grow by 15,600 aircraft -- at an average rate of 2.1 percent a year over the

forecast period, with the turbine jet portion increasing at 2.5 percent a year.

While steady growth in GDP and long term corporate profits impacts continued growth of the turbine and rotorcraft fleets, the largest segment of the fleet, fixed wing piston aircraft is predicted to shrink over the forecast period by 17,500 aircraft (at an average annual rate of 0.6 percent).

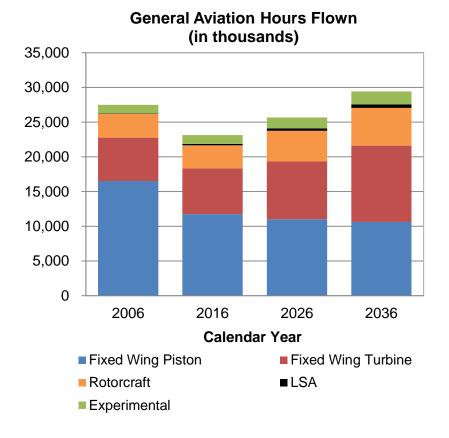

On the other hand, currently the smallest category, light-sport-aircraft, which was created in 2005, is forecast to grow by 4.5 percent annually, adding about 3,900 new aircraft by 2036, nearly tripling its 2014 fleet size.

Moderate fleet growth also impacts the number of general aviation hours flown, projected to increase an average of 1.2 percent per year through 2036. Following the decline in piston fleet, fixed wing piston hours are forecast to decrease by 0.6 percent. Countering this trend, hours flown by turbine aircraft (including rotorcraft) are forecast to increase 2.6 percent yearly over the fore-

cast period. Jet aircraft are expected to account for most of the increase, with hours flown increasing at an average annual rate of 3.1 percent over the forecast period. The large increases in jet hours result mainly from the increasing size of the business jet fleet, along with continuing increase in utilization rates, as indicated by the GA Survey.

Rotorcraft activity, which was not as heavily impacted by the previous economic downturn as other aircraft and rebounded earlier, faces the challenges brought by lower oil prices. They impact utilization rates and new aircraft orders both directly through decreasing activity in oil exploration, and also through associated slowdown in related economic activity. Rotorcraft hours are projected to grow by 2.5 percent annually over the forecast period.

Lastly, the light sport aircraft category is forecasted to see an increase of 5.0 percent a year in hours flown, primarily driven by growth in the fleet.

The FAA also conducts a forecast of pilots by certification categories, using the data compiled by the Administration's Mike Monroney Aeronautical Center. There were 590,039 active pilots certificated by FAA at

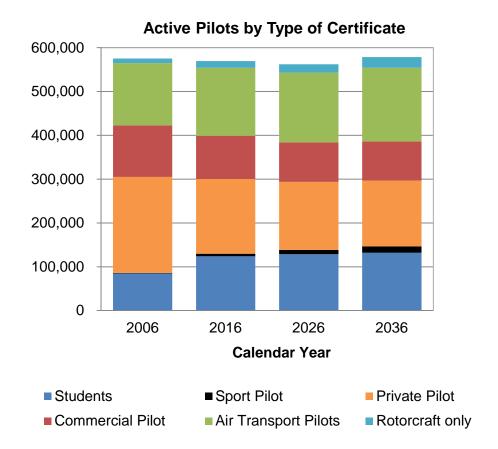

the end of 2015. While private and commercial pilot categories kept their declining trends, student pilot certificates continued to increase. One regulatory change that affected the number of student pilot certificates was the 2010 rule that increased the duration of validity for student pilot certificates for pilots under the age of 40 from 36 months to 60 months. Since 2011, the student pilot numbers have been rising and reached 122,729 in 2015.

Another change in the legislation impacted commercial and air transport pilot (ATP) certificates. The Airline Safety and Federal Aviation Administration Extension Act of 2010 mandated that all part 121 (scheduled airline) flight crew members would hold an ATP certificate by August 2013. The airline pilots holding a commercial pilot certificate and mostly serving at Second in Command positions at the regional airlines could no

longer operate with only a commercial pilot certificate after that date, and the FAA data showed a faster decline in commercial pilot numbers, accompanied by a higher rate of increase in ATP certificates.

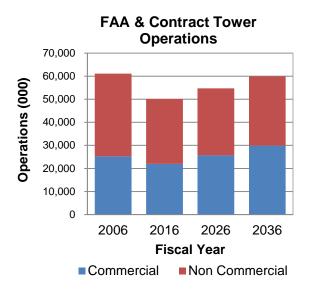

The number of active general aviation pilots (excluding ATPs) is projected to decrease about 5,000 (down 0.1 percent yearly) over the forecast period, while the ATP category

is forecast to increase by 13,600 (up 0.4 percent annually). The student pilots are forecast to increase by 0.3 percent and much smaller category of sport pilots are predicted to increase by 4.8 percent annually over the forecast period. On the other hand, both private and commercial pilot certificates are projected to decrease by 0.6 percent yearly until 2036.

FAA Operations

The growth in air travel demand and the business aviation fleet will drive growth in operations at FAA facilities over the forecast period. Activity at FAA and Contract towers is forecast to increase at an average rate of 0.9 percent a year between 2016 and 2036. Commercial operations⁴ at these facilities are forecast to increase 1.5 percent a year, 5 times faster than non-commercial operations. The growth in commercial operations is less than the growth in U.S. airline passenger traffic (1.5 percent vs 2.0 percent) over the forecast period due primarily to larger aircraft (seats per aircraft mile) and higher load factors. Both of these trends allow U.S. airlines to accommodate more passengers without increasing the number of flights. General aviation operations (which accounted for 52% of operations in 2015) are forecast to increase an average of 0.3 percent a year as increases in turbine powered activity more than offset declines in piston activity.

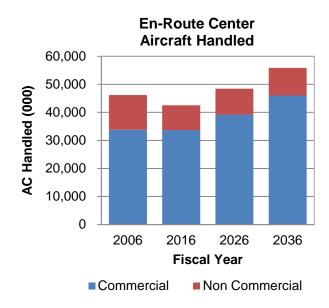

FAA Tracon (Terminal Radar Approach Control) Operations⁵ are forecast to grow slightly faster than at towered facilities. This is in part a reflection of the different mix of activity at Tracons. Total operations are forecast to increase an average of 1.1 percent a year between 2016 and 2036. Commercial operations accounted for approximately 59 percent of Tracon operations in 2015 and are projected to grow 1.5 percent a year over the forecast period. General aviation activity at these facilities is projected to grow only 0.4 percent a year over the forecast.

Activity at FAA En-Route Centers is measured by the number of IFR aircraft handled.

⁴ Sum of air carrier and commuter/air taxi categories.

⁵ Tracon operations consist of itinerant Instrument Flight Rules (IFR) and Visual Flight Rules (VFR) arrivals and departures at all airports in the domain of the Tracon as well as IFR and VFR overflights.

In 2015, aircraft handled at FAA En-Route Centers increased 1.4 percent, led by increases in the Air Carrier and General Aviation categories. Growth in airline traffic and business aviation is expected to lead to increases in activity at En-Route centers. Over the forecast period, aircraft handled at En-Route centers are forecast to increase at an average rate of 1.4 percent a year as increases in Air Carrier and General Aviation activity offset declines in Air Taxi activity. Activity at En-Route centers is forecast to grow much faster than activity at towered airports because more of the activity at En-Route centers is from the faster growing commercial sector and high-end (mainly turbine) general aviation flying. Much of the general aviation activity at towered airports, which is growing more slowly, is local in nature, and does not impact the centers.

U.S. Commercial Aircraft Fleet

The number of aircraft in the U.S. commercial fleet is forecast to increase from 6,871 in 2015 to 8.414 in 2036, an average annual growth rate of 1.0 percent a year. Increased demand for air travel and growth in air cargo is expected to fuel increases in both the passenger and cargo fleets.

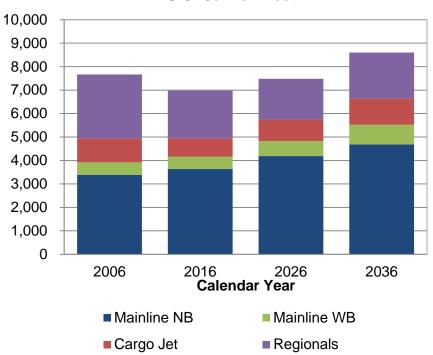

Between 2015 and 2036 the number of jets in the U.S. mainline carrier fleet is forecast to grow from 3,946 to 5,339, an average of 66 aircraft a year as carriers continue to remove older, less fuel efficient narrow body aircraft. The narrow body fleet (including Eseries aircraft at American and JetBlue) is projected to grow 51 aircraft a year as carriers replace the 757 fleet and current technology 737 and A320 family aircraft with the next generation MAX and Neo families. The wide-body fleet grows by an average of 15 aircraft a year as carriers add 777-8/9, 787's, A350's to the fleet while retiring 767-300 and 777-200 aircraft. In total the U.S. passenger carrier wide-body fleet increases by 60 percent over the forecast period.

The regional carrier fleet is forecast to decline from 2,144 aircraft in 2015 to 1,961 in 2036 as the fleet shrinks by 21 percent (448

aircraft) between 2015 and 2022. Carriers remove 50 seat regional jets and retire older small turboprop and piston aircraft, while adding 70-90 seat jets, especially the E-2 family after 2020. By 2025 only a handful of 50 seat regional jets remain in the fleet. By 2036, the number of jets in the regional carrier fleet totals 1,786, up from 1,628 in 2015. The turboprop/piston fleet is forecast to shrink by two-thirds from 516 in 2015 to 175 by 2036. These aircraft account for just 8.9 percent of the fleet in 2036, down from 24.1 percent in 2015.

The cargo carrier large jet aircraft fleet is forecast to increase from 781 aircraft in 2015 to 1,114 aircraft in 2036 driven by the growth in freight RTMs. The narrow-body cargo jet fleet is projected to increase by 2 aircraft a year as 757's and 737's are converted from passenger use to cargo service. The wide body cargo fleet is forecast to increase 14 aircraft a year as new 747-800, 767-300, and 777-200 aircraft are added to the fleet, replacing older MD-11 and 767-200 freighters.

Unmanned Aircraft Systems

An Unmanned Aircraft System (UAS) is the unmanned aircraft (UA) and its associated elements (including communication links and the components that control the unmanned aircraft) that are required for the safe and efficient operation of the unmanned aircraft in the national airspace system (NAS). The forecast will be driven by a combination of an improved regulatory environment and underlying demand. In 2015, unprecedented milestones were achieved for UAS. The FAA is continuing to enable this new thriving industry to flourish while maintaining safety.

Education, Outreach, and Research

The FAA is partnering with several industry associations for the "Know Before You Fly" educational campaign. This outreach promotes the safe and responsible use of unmanned aircraft as they become integrated into the NAS. The FAA also developed and made available an app, B4UFLY which provides UAS operators with pertinent airspace requirements and restrictions before operating.

Six FAA-selected UAS test site operators are providing information on system safety, data gathering, aircraft certification, command and control link issues, control station layout and certification, ground and airborne sense and avoid, and environmental impacts. In addition, a team led by Mississippi State University has been identified as the FAA's Center of Excellence for Unmanned Aircraft Systems (COE UAS). The COE will focus on research, education, and training in areas critical to safe and successful integration of UAS into the nation's airspace.

Exemptions and Authorizations

Section 333 of the FAA Modernization and Reform Act of 2012 grants the Secretary of Transportation the authority to determine whether an airworthiness certification is required for certain UAS to operate safely in the NAS. This determination is based on the size, weight, speed, and operational capabilities of the aircraft. Using the FAA's exemption process, a safety evaluation is conducted, and appropriate conditions and limitations for the operation are imposed through each exemption granted. March 16, 2016, over 4,000 exemptions have been granted for commercial UAS operations in the United States under the Section 333 authority. This demonstrates considerable potential demand for UAS operations, in low-risk, controlled environments. In addition, commercial UAS operations must be conducted in accordance with a Certificate of Authorization or Waiver (COA) issued by the FAA Air Traffic Organization. The COA describes the specific operating areas approved for UAS operations and associated mitigations that help to ensure the safety of the NAS.

Model Aircraft and Hobbyist Forecast

In order to operate in the NAS, the FAA must ensure that aircraft operators are not only aware of the system in which they are operating, but that the agency also has a means to identify owners. One means to accomplish this is through aircraft registration and marking. On December 14, 2015, the FAA issued a rule requiring all UAS weighing more than 0.55 pounds (250 grams) and less than 55 pounds to be registered using a new on-line system (UAS weighing more than 55 pounds must be reg-

istered using the existing Aircraft Registration Process). This registration rule will aid in investigations and allow the FAA to gather data about UAS use. As of mid-March, 2016 there have been over 408,000 registrations.

As shown in the following table, a sales forecast was developed for the small UAS registration rule, which included very small

units below the registration size cutoff of 250 grams. For this interim final rule, in 2016, we forecast 1.9 million potential annual sales and that number could increase to 4.3 million units sold annually by 2020. As shown in the first row of the table below, this would represent the upper bound of the potential number of small UAS operated as model or hobby aircraft.

Sales Forecast Summary Million sUAS Units

	2016	2017	2018	2019	2020
Hobbyist (model aircraft)	1.9	2.3	2.9	3.5	4.3
Commercial (non-model aircraft)	0.6	2.5	2.6	2.6	2.7
	2.5	4.8	5.5	6.1	7.0

Note: Numbers may not add due to rounding

Commercial Forecast

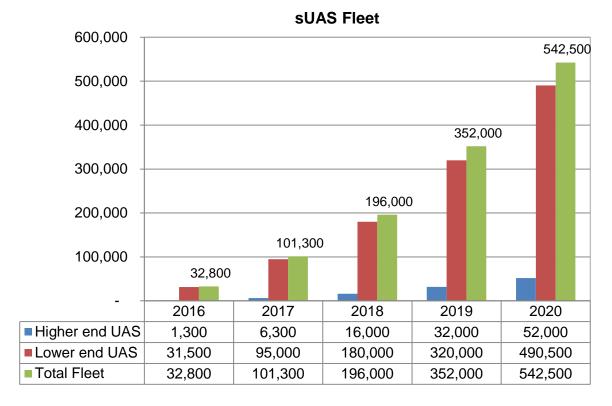

In 2015, in support of the small UAS registration rule, a sales forecast for commercial UAS was developed to derive the potential demand for the new on-line registration system. That forecast represents the high end of the small UAS commercial fleet. As summarized in the second row of the previous table, for 2016, the potential sales of commercial small UAS requiring registration was forecast to be over 600,000, growing to 2.7 million by 2020.

On February 23, 2015, the FAA issued the Operation and Certification of Small Unmanned Aircraft Systems Notice of Proposed Rulemaking (NPRM) proposing to amend its regulations to adopt specific rules for the operation of small UAS in the NAS. Over 4,600 public comments were submitted in response to the NPRM. The FAA expects to publish a final rule in late spring of 2016. More information on the derivation and assumptions behind this forecast will be provided in the Regulatory Impact Assess-

ment accompanying the final rule publication.

The FAA is working with the Teal Group Corporation, an industry expert in UAS fore-casting, to develop a commercial forecast for small UAS operations described in the NPRM. The civil and commercial UAS market will take time to develop and the size of the market will directly relate to the specific requirements developed along with airspace accessibility. The Teal Group has provided the FAA with a forecast for small commercial unmanned aircraft. This forecast analyzes the market demand for different sectors within the regulatory environment.

As shown in the graph below, it is expected that, once the final small UAS rule is implemented, two different categories of small UAS (sUAS) will emerge. Higher end sUAS will have an average sales price of \$40,000 per unit, while lower end units will have an average price of \$2,500. Over a five year period, Teal Group forecasts the sUAS fleet to be approximately 542,500.

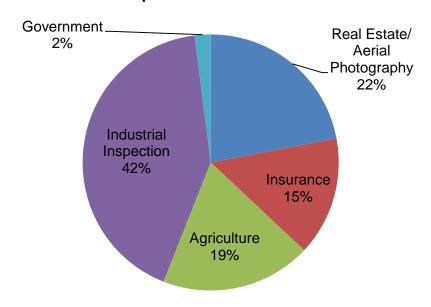

Of this estimated fleet, it is expected that roughly 90% of the demand will satisfied by the lower end units.

The number of small UAS forecasted is highly uncertain and is dependent on the regulatory structure ultimately adopted. Once a final rule for small UAS is published, they will become more commercially viable

than they are today. The total fleet shown in the previous table is expected to satisfy the market for the top five industries that will employ the use of sUAS.

Top Five sUAS Markets

Looking beyond existing regulatory initiatives. FAA has developed the UAS Focus Area Pathfinders initiative. This initiative explores how UAS might be safely used in populated areas, how UAS flights outside the pilot's direct vision might allow greater UAS use in rural areas, and some of the command-and-control challenges of using UAS beyond visual line of sight in rural/isolated areas. The overall demand for commercial UAS will soar once regulations more easily enable beyond visual line of sight (BVLOS) operations and operations of multiple UA by a single pilot. Once a

framework is enabled for BVLOS operations, the projected market sizes could be higher than the forecast

Venture capitalists are already investing considerable amounts of money into this emerging industry with the intention to build early market share in this technology. Manufacturers' efforts are focused on building systems optimized for particular segments of the market. Unmanned aircraft systems will be the most dynamic growth sector within aviation. The FAA will continue to work with industry and stakeholders to safely integrate UAS into the NAS.

Commercial Space Transportation

The Federal Aviation Administration's Office of Commercial Space Transportation (FAA AST) and the Commercial Space Transportation Advisory Committee (COMSTAC) have prepared forecasts of global demand for commercial space launches in 2015 through 2024.

The 2015 Commercial Space Transportation Forecasts report (the Report) is in two sections:

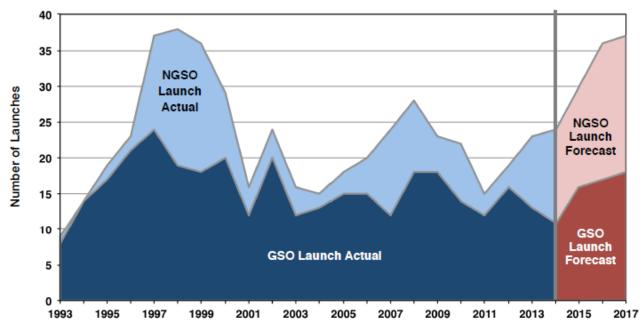

- The COMSTAC 2015 Commercial Geosynchronous Orbit (GSO) Launch Demand Forecast, which projects demand for commercial satellites that operate in GSO and the resulting commercial launch demand to GSO. As a result of the realignment of issuances dates of the Report, this year's GSO Launch Demand Forecast only considers the three-year outlook; and
- The FAA's 2015 Commercial Space Transportation Forecast for Non-Geosynchronous Orbits (NGSO), which projects commercial launch demand for

satellites to NGSO, such as low Earth orbit (LEO), medium Earth orbit (MEO), elliptical (ELI) orbits, and external (EXT) trajectories beyond orbits around the Earth.

Report projects an average of 17 commercial GSO launches for 2015 through 2017 and 13.1 NGSO launches for 2014 through 2013. The chart below shows the combined GSO and NGSO Historical Launches and Launch Forecast. It reflects the three year GSO forecast outlook. The table below shows the number of GSO and NGSO payloads and launches projected from 2015 and 2024.

It is important to distinguish between forecast demand and the number of satellites actually launched. Launch vehicle and satellite programs are complex, and susceptible to delays, which generally makes the forecast demand for launches the upper limit of actual launches in the near-term forecast.

Combined 2015 GSO and NGSO Historical Launches and Launch Forecasts

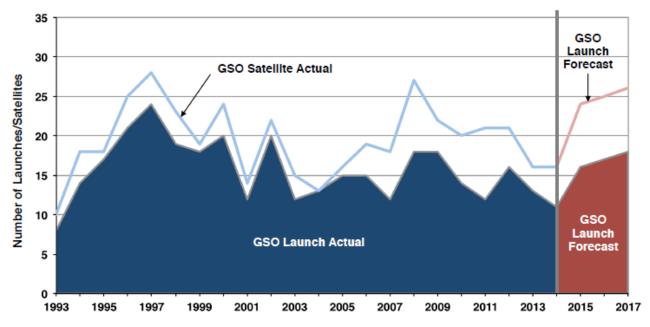

Commercial Space Transportation Payload and Launch Forecasts

Confinercial opace 11			<u> </u>					0000	0000	0004	T - 4 - 1	A .
	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	Total	Avg.
				Pa	ayload	5						
GSO Forecast (COMSTAC)	24	25	26			-					1	25.0*
NGSO Forecast (FAA)	65	136	151	104	92	92	87	86	87	86	986	98.6
Total Payloads	89	161	177									
				La	unche	s						
GSO Med-to-Heavy	16	17	18								-	
NGSO Med-to-Heavy	13	17	15	13	11	10	10	10	10	10	119	11.9
NGSO Small	1	2	4	2	1	0	1	0	1	0	12	1.2
Total Launches	30	36	37		-	1	-					

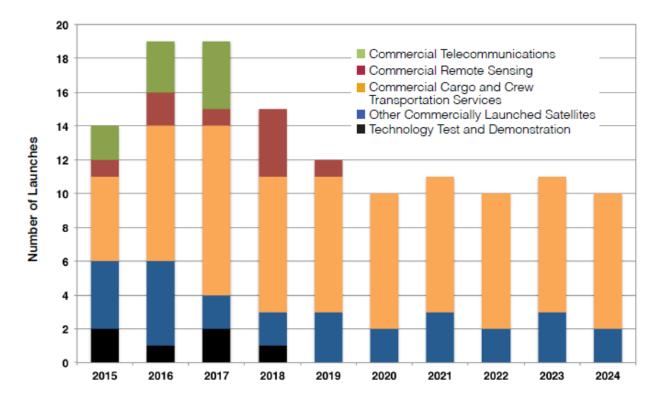

The GSO market remains stable with a projected demand of 25 satellites per year for the period 2015-2017, up from last year's average for 22.3 for the period 2014-2016. The chart below shows the 2015 GSO Historical Launches and Launch Forecast. Thirty-nine percent of GSO satellites projected to launch from 2015-2017 are in the heaviest mass class (above 5,400 kg). At the same time, seven percent of the satellites in the same period are in the lowest mass class (below 2,500 kg). In 2015, unaddressable launches remained at the

comparably high level – launch contracts that were not open to international (including U.S.) competition – as Chinese and Russian government-owned aerospace companies routinely package satellites, launches, and financing together. The satellite services market is generally robust, and new launch vehicle options will affect the dynamics of the launch industry. Operators are cautious about the impact of the economy on their plans but are generally satisfied with satellite and launch vehicle offerings.

2015 GSO Historical Launches and Launch Forecast

Projected NGSO Launches from 2015-2024

The demand for commercial NGSO launches is expected to be at a comparably high level as major NGSO telecommunication constellations are replenished and National Aeronautics and Space Administration (NASA) International Space Station (ISS) commercial crew and cargo resupply missions become more regular. The annual average of NGSO commercial launches is expected to grow from an annual average of seven launches a year over the last ten years to about 11.9 launches annually. From 2015-2024, 986 payloads are projected to launch commercially, driving only 131 launches with multi-manifesting, reflecting an industry planning to launch more microand small-class payloads in clusters, instead of increasing the demand for individual launches. The chart above shows the projected NGSO launches for the next ten years. The launches in the next ten years are predominantly commercial launches to the International Space Station, which require medium-to-heavy vehicles. one percent of all commercial NGSO launches during the forecast period will launch on medium-to-heavy vehicles. The relatively higher number of small launches is due to Skybox Imaging's plans to use Minotaur C to deploy its constellation and the first test flights of four newly developed commercial small launch vehicles in 2015-2017, to be introduced for commercial launch services in the following years. From 2015-2018 the Report forecasts a number of small commercial satellites to be launched as Iridium, ORBCOMM, Planet Labs, and Skybox all deploy their constellations. The number of these multimanifested satellites drops off towards the end of the forecast, but the number of launches remains relatively steady as NASA begins its commercial crew program.

Risks to the Forecast

The forecasts in this document are forecasts of aviation demand, driven by models built on forecasts of economic activity. There are many assumptions in both the economic forecasts and in the FAA models that could impact the degree to which these forecasts are realized. This year's forecast is driven, at least in the short-term, by a number of factors including the strength of the economic recovery and any impact resulting from the U.S. government fiscal situation. Also, as numerous incidents in the past few years (like the downing of a Russian A321 in the Sinai in October 2015) remind us, terrorism remains among the greatest risks to aviation growth. Any terrorist incident aimed at aviation would have an immediate and significant impact on the demand for aviation services that would be greater than its impact on overall economic activity.

Although oil prices remained below \$60 per barrel for most of 2015, the recent volatility reminds us there is still considerable uncertainty as to the future direction of oil prices. The FAA's baseline forecast (derived from economic assumptions in IHS Global Insight's December 2015 U.S. macro forecast and 30-Year Focus released during the fourth quarter of 2015) calls for a decline in oil prices in 2016 to \$43 per barrel and then rising steadily thereafter, exceeding \$75 by 2020, \$125 by 2025, and reaches \$152 per barrel by the end of the forecast period in 2036. Some forecasters are calling for a more gradual rebound in the price of oil. In January 2016, the World Bank released its latest commodity price forecast. The forecast calls for oil prices to fall to \$34 per barrel in 2016, remaining below \$60 until 2021, and only exceeding \$80 per barrel by 2025. The International Monetary Fund (IMF) also sees oil price increasing at a more moderate rate than the FAA's base forecast, as its January 2016 forecast called for oil prices increasing from \$35 per barrel in 2016 to only \$50.50 per barrel by 2021. Over the long run, lower oil prices give consumers an impetus for additional spending, including air travel, and should enhance industry profitability.

The baseline forecast assumes that global economic growth will accelerate after 2016, but weakness in certain areas may threaten the strength and sustainability of the expansion. The baseline forecast assumes that China and India will be growth engines for emerging economies as China successfully transitions the economy from reliance on heavy manufacturing and resource industries to one more oriented towards the services and technology sectors and India continues to implement reforms to make its economy more competitive. While economic growth appears to be holding up in the U.S., there are concerns about the strength of demand in Japan and in the European Union as these areas continue to be constrained by structural economic problems (high debt, slow population growth, weak public finances for example). Furthermore, the steps that were taken to stabilize the global economy during the Great Recession have resulted in additional distortions and imbalances. There are concerns that central banks may not raise interest rates in time to contain asset bubbles and inflationary expectations. In advanced economies, governments need to shore up their finances by constraining spending and raising taxes. Given the discomfort many policy makers feel about the measures adopted to

combat the Great Recession and uncertainty about the advanced economies' prospects, there is considerable risk that authorities will either act prematurely or be excessively timid and late in taking necessary steps. The current forecasts assume strong passenger growth for travel between the United States and other world regions. Any slowing of worldwide economic activity could seriously inhibit the growth in global passenger demand.

With the merger of American Airlines and US Airways completed, the outlook for further consolidation via mergers and acquisitions (M&A) appears to be rather limited. Based on FY 2015 data, the Big 3 (American, Delta, and United) plus Southwest accounted for more than 76% of the U.S. airline industry capacity and traffic. Of the network carriers, only Alaska remains independent, although it does have code share agreements with both American and Delta. There appears to be little appetite for further consolidation as there are significant obstacles. For many low cost carriers, the sheer size of merger transactions or the amount of financial risk associated with a merger makes further merger activity unlikely. For the network carriers, regulatory authorities are increasing their scrutiny over carrier practices (e.g. Department of Justice investigation into impacts of "capacity discipline" on pricing) suggesting and any future proposed merger will face a less receptive audience than in the past decade.

However, U.S. airlines continue to explore other options including global alliances. Many of the major carriers in the U.S. are members of global alliances that operate with some measure of anti-trust immunity from the U.S. DOT. While anti-trust immunity may provide flexibility for airline operators across borders, it may create an anti-

competitive environment in the marketplace. These market consolidating vehicles, particularly the anti-trust immunity provisions, may invite increased regulatory scrutiny. If such oversights are launched in the future, this will complicate the evolving structure of the airline industry and may impact demand via new regulations.

The forecast assumes the addition of sizable numbers of large regional jets (70 to 90 seats) into the fleet of regional carriers. However, network carrier consolidation and new rules on pilot training have left regional carriers saddled with either excess capacity or a lack of pilots. Although air travel demand continues to recover, the bankruptcy filing of Republic Airlines in February 2016 is a reminder that financial pressures on regional operators have not abated. Network carriers continue to make adjustments to the size and breadth of their networks, without providing opportunities for regional carriers to backfill the loss of the mainline service. Delta is well along in its plans to reduce its small (read 50 seat) regional jet fleet and plans to retire another 50 to bring its total to just 125, down from almost 500 at the end of 2009. United has reduced the number of small regional jets flown by its partners from an estimated 380 in 2012 to 242 by the end of 2015 with a target of 100 by 2019. It is adding 85 Embraer 175's to its partners' regional fleet to partially replace the reduction in small jet flying. Meanwhile the new American Airways is planning to reduce its small regional jet fleet by 29 aircraft in 2016, after removing 31 in 2015. At the same time the carrier plans to add 49 larger regional jets to its fleet in 2016. While these actions may provide some opportunities for well positioned regional carriers, the overall impact of consolidation so

far has been to reduce opportunities for regional flying substantially.

After suffering through a significant downturn in 2009, business and corporate aviation have seen a partial recovery during the past five years. The pace of the recovery in business and corporate aviation is largely based upon the future prospects of economic growth and corporate profits. Future uncertainty in these leading indicators could pose a risk to the forecast, but the risk is not limited to these factors. Public perception of business and corporate aviation, potential environmental regulations and taxes, along with increased security measures placed on business jets, will place downward pressure on the forecast. On the other hand, while corporate profits are currently high, perceived economic and political uncertainties are causing companies to postpone their purchase of new business aircraft. Translation of this pent-up demand into sales of business jets in the near future can create an upward impact on the forecast. The impact of fuel price decline on business aircraft demand is also uncertain. While a positive effect on corporate profits will increase the demand, revenue losses resulting from low fuel prices may move the demand in the other direction.

Other factors, such as new and more efficient product offerings and increased competition from new entrant manufacturers, serve to broaden the potential of the industry. The potential easing of regulations on the use of airspace in foreign countries would offer promising scenarios for business jet manufacturers. Raising the level of security restrictions, and the subsequent travel hassles placed on airline passengers, could make corporate jet travel look increasingly appealing.

Not only is the volume of aircraft operating at most large hubs expected to increase over the next 20 years, but the mix of aircraft is changing for this same period. The expected increases in the numbers of regional jets and business jets will increase the impact on the national airspace system and make the FAA's job more challenging. This change in the mix of aircraft will impact workload strictly due to the increasing demand for aviation services projected over the forecast period.

While overall activity at FAA and contract towers increased 0.2 percent in 2015, activity at the Core 30 airports increased 0.7 percent in 2015 and delays remained at historically high levels at many U.S. airports. FAA forecasts operations at these airports to grow substantially faster than the overall national trend. As demand recovers and workload increases, congestion and delays could become a critical limit to growth over the forecast period. FAA's forecasts of both demand and operations are unconstrained in that they assume that there will be sufficient infrastructure to handle the projected levels of activity. Should the infrastructure be inadequate and result in even more congestion and delays, it is likely that the forecasts of both demand and operations would not be achieved.

There are concerns that aviation's impact on the environment could potentially restrict the ability of the aviation sector to grow to meet national economic and mobility needs. Airport expansion or new construction is often a contentious issue because of noise, air quality, and water quality concerns. There is also an ongoing effort to address the climate impacts of aviation. Aviation currently accounts for 2 to 3 percent of global carbon emissions, but this percentage is expected to increase with the growth

in operations unless mitigated with new technologies and standards, renewable fuels, operational improvements and potentially as a gap filler, market based measures. While certain measures to address climate impacts can result in reduced costs, such as increased fuel efficiency, other measures, such as market instruments could pose additional constraints on growth. Energy concerns are also rising, driven by spikes in fuel prices, supply and security issues, and concerns about fossil fuel emissions contributing to global climate change. Lack of progress in improving the environmental and energy outlook for the future fleet may result in more access restrictions or operating limitations on the fleet in service which in turn may depress growth. By contrast, breakthroughs in quieter, cleaner aircraft technologies and renewable fuels could reduce environmental and energy constraints on the forecast, and enable sustainable growth.

Appendix A: Alternative Forecast Scenarios

Uncertainty exists in all industries, but especially in the commercial air travel industry. As volatility in the global environment has increased, the importance of scenarios for planning purposes has increased. In order to help stakeholders better prepare for the future, the FAA has provides alternative scenarios to our baseline forecasts of airline traffic and capacity.

To create the baseline domestic forecast, economic assumptions from IHS Global Insight's 10-year and 30-year U.S. Macro Baselines were used. To develop the alternative scenarios, assumptions from IHS Global Insight's 10-year and 30-year optimistic and pessimistic forecasts from their January 2016 Baseline U.S. Economic Outlook were used were used. Inputs from these alternative scenarios were used to create a "high" and "low" traffic, capacity, and yield forecast.

International passengers and traffic are primarily driven by country specific Gross Domestic Product (GDP) forecasts provided by IHS Global Insight. Thus, the alternative scenarios use inputs based on ratios derived from IHS Global Insight's Major Trading Partner and Minor Trading Partners optimistic and pessimistic forecasts in order to create a high and low case.

Scenario Assumptions

The FAA's domestic baseline forecast assumes that the economy recovers from the current downturn and experiences very low oil prices in the short term, suffers no major swings in macro-economic policy, or financial sector collapses.

The FAA's high case forecast uses IHS Global Insight's optimistic forecast. The optimistic forecast sees improved business confidence leading to renewed vigor in the labor market, consumer spending, and sustained improvements in the housing sector as well as sustained low consumer prices, higher real personal consumption expenditure, relatively low Brent crude prices, and a high GDP. Furthermore, in the optimistic case, it is assumed that fiscal deficits will diminish substantially in North America, Western Europe, and Japan. In this scenario real personal consumption expenditure (PCE) per capita growth averages 0.4 percentage points faster per year than the baseline forecast⁶ and unemployment averages 0.3 points lower on a fiscal year basis than the baseline.7

Conversely, FAA's low case forecast uses IHS Global Insight's pessimistic scenario; in this forecast, the same assumptions apply as in the optimistic case, only the U.S. economy recovers at a much slower pace and the prices of Brent crude rise higher than in the base case. Moreover, the Eurozone's recovery will stall and growth in emerging markets will be less robust. Lastly, real PCE per capita grows 0.4 percentage points slower per year than in the baseline; and unemployment, on average, is

43

⁷ Real personal consumption expenditure per capita and unemployment are used as an input variables to the FAA's base, high and low forecasts of enplanements.

0.35 points higher on an annual basis than in the baseline.

The price of energy is one of the critical drivers in the growth of consumer prices over the forecast period. In the optimistic case, energy prices, wages, and import prices grow more slowly than in the base-

line. In the pessimistic case the opposite occurs with energy prices, wages and import prices rising more rapidly compared to the baseline.

Alternative Forecasts

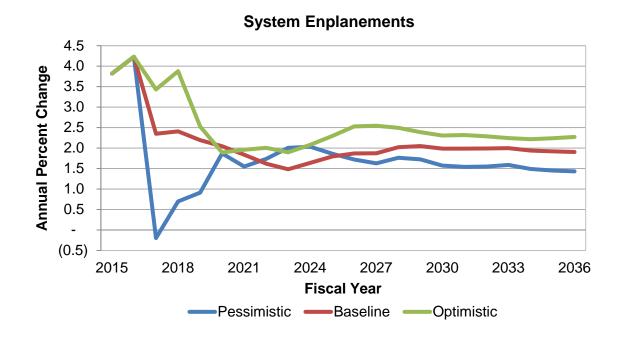

Enplanements

In the baseline forecast, system enplanements are forecast to grow at an average annual rate of 2.2 percent a year over the forecast horizon of 2016-2036 (with domestic and international passengers up 2.0 and 3.6 percent, respectively).

In the optimistic case, enplanements grow at a quicker pace, averaging 2.7 percent per year (up 2.6 percent domestically and 3.6 percent internationally). This scenario is marked by a more favorable business environment, lower inflation, and lower fuel prices which make the price of flying more affordable to business and leisure travelers. By the end of the forecast period in 2036, system passengers in the optimistic case

are 10.7 percent above the baseline, totaling 1.4 billion, 132 million than in the baseline.

The pessimistic case is characterized by a period of weakened consumer confidence brought on by persistent unemployment, low consumer demand, and higher inflation. In this scenario enplanements grow an average of 1.7 percent per year (domestic up 1.4 percent and international up 3.6 percent). In the pessimistic case, system passengers in 2036 are 9.8 percent below the baseline case, totaling 1.1 billion, 121 million fewer than in the baseline.

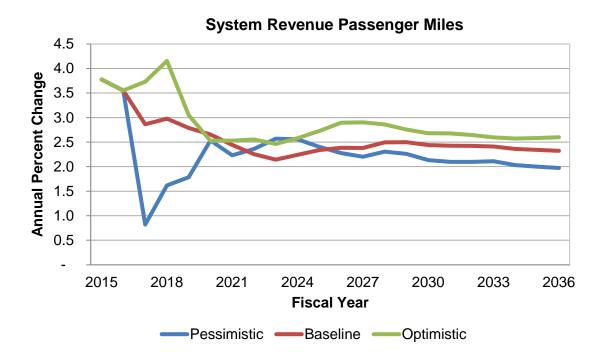

Revenue Passenger Miles

In the baseline forecast, system RPMs grow at an average annual rate of 2.5 percent a year over the forecast horizon (2016-2036), with domestic RPMs increasing 2.0 percent annually and international RPMs growing 3.5 percent annually.

In the optimistic case, the faster growing economy coupled with lower energy prices drives RPMs higher than the baseline, with growth averaging 2.8 percent per year (do-

mestic and international RPMs up 2.5 and 3.5 percent, respectively).

In the pessimistic case, the combination of a slower growing economy and higher energy prices result in RPM growth averaging 2.1 percent annually with domestic markets growing 1.4 percent a year while international traffic grows 3.5 percent annually.

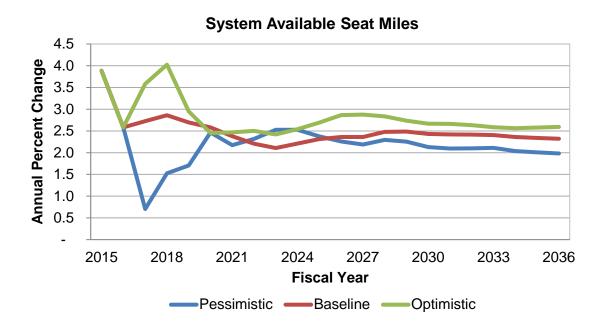

Available Seat Mile

In the base case, system capacity is forecast to increase an average of 2.5 percent annually over the forecast horizon with growth averaging 2.1 percent annually in domestic markets and 3.4 percent a year in international markets. In the optimistic case, capacity grows at a faster clip than in the baseline forecast, averaging 2.9 percent annually system-wide (up 2.7 percent domestically and up 3.4 percent internationally). Carriers increase capacity compared to the baseline forecast to accommodate increased travel demand

brought about by a more favorable economic environment.

In the pessimistic case, demand for air travel is lower than in the baseline, thus system

capacity grows at a slower pace of 2.2 percent annually (domestic growth of 1.5 percent annually and international up 3.4 percent annually).

Load Factor

System load factors over the 20-year forecast period are relatively similar for all three forecast scenarios. In the base case and in the optimistic scenario, system load factor rises from 84.2 percent in 2016 to 84.7 percent and 84.9 in 2036, respectively.

In all three scenarios it is assumed that carriers will keep load factors on the high side by actively managing capacity (seats) to more precisely meet demand (passengers).

The domestic load factor increases over the forecast horizon from 85.1 percent to 86.5 percent in all scenarios.

The international load factor forecast is slightly different in the three scenarios, reflecting in part the relative growth in demand and capacity in the three (Atlantic, Latin, and Pacific) international regions under each scenario.

In the base case, international load factor is relatively steady, going from 81.9 percent in 2016 to 81.7 percent in 2036, the same load factor in the optimistic and pessimistic scenarios.

Yield

In the baseline forecast, nominal system yield increases 1.9 percent annually, going from 13.98 cents in 2016 to 21.17 cents in 2036. In domestic markets, yield in the baseline forecast rises from 14.12 cents in 2016 to 22.06 cents in 2036, while international yield rises from 13.66 cents in 2016 to 19.50 cents in 2036.

System yield rises more slowly in the optimistic case, up 1.8 percent annually to be 20.68 cents at the end of the forecast period. Domestic yield increases to 21.24 cents while international yield increases to 19.50 cents. The slower growth in yield in the high case is due to advancements in technology, gains in productivity, more favorable fuel prices, and lower inflation. Increased

competition is also assumed in this scenario. In the domestic market, fares are driven lower than baseline levels due to increased levels of competition between low cost and legacy carriers. In the international market, increased competition from growing liberalization puts downward pressure on fares.

In the pessimistic case, nominal yields rise more rapidly than in the baseline, growing an average of 2.5 percent annually, reaching 24.18 cents by 2036 (26.98 cents domestically and 19.52 cents internationally). This scenario reflects higher general inflation and higher energy prices than in the baseline, forcing carriers to increase fares in order to cover the higher costs of fuel, labor, and capital.

Appendix B: FAA Forecast Accuracy

Forecasts, by their nature, have a degree of uncertainty incorporated in them. They involve not only statistical analyses and various scientific methods, but also judgment and reliance on industry knowledge and the forecaster's experience to incorporate industry trends not yet reflected in recent results. The FAA's annual Aerospace Forecast is no exception. Given the volatile nature of the U.S. airline industry, it is not surprising that each year's forecast would contain a certain degree of forecast variance. Therefore, FAA forecasters have tried to build forecast models that give a consistent and predictable pattern of results. Analysts relying on the forecasts produced by the models would then be able to adjust for the predictable variance from actual results.

The table below presents an analysis of the variance from historical results for a primary forecast assumption along with five key forecast metrics during the FY 2005-2015 forecast period. Although this period has experienced industry upheaval, the FAA's forecast methodology remained consistent during this time. For this reason, inclusion of prior periods in an analysis of forecast variance might lead to inconclusive or inaccurate implications about the accuracy of FAA's current forecast methodology.

The table below contains the mean absolute percent errors for the projected values versus the actual results for U.S. carriers' system operations along with the projected values versus actual results for U.S. GDP. Each metric has five values showing the relative forecast variance by the number of years in advance the preparation of the forecast took place. For example, the "3"

Years" column for ASMs shows that the mean absolute percent error was 6.9 percent for ASM forecasts prepared 3 years in advance. For the period under examination, preparation of the forecasts for FY 2005 through FY 2015 occurred in FY 2001 through FY 2014.

⁸ It should be noted that the first forecasted year for each respective fiscal year is that very same year. Therefore, FY 2003's first forecasted year is FY 2003, and the third forecasted year is FY 2005.

U.S. AIR CARRIERS SYSTEM SCHEDULED PASSENGER ACTIVITY FORECAST EVALUATION

Forecast Variable	Mear	(Foreca	nt Error (Combin ast Variance fron erformed Years P	•	2015)
	1 Year	2 Years	3 Years	4 Years	5 Years
U.S. Real GDP ASMs RPMs	2.0% 0.8% 1.1%	3.4% 3.8% 3.0%	5.3% 6.9% 5.5%	7.1% 10.4% 8.0%	8.3% 15.8% 11.7%
Passenger Enplanements	1.0%	2.7%	5.4%	7.8%	11.6%
Mainline Domestic Yield	3.4%	4.7%	6.4%	8.1%	10.4%
IFR Aircraft Handled*	2.2%	5.5%	8.4%	11.5%	15.9%

^{*}Total - scheduled and nonscheduled commercial plus noncommercial

Presenting forecast variances from actual data in such a manner simplifies a review of longer-term trends. Typically, one would expect the variances to de-crease as the forecast year is closer to the year the forecast is prepared. Presenting forecast variances in this way allows an examination of changes in the relative variances by time horizon, signaling when dramatic shifts in accuracy occur.

Examination of the forecast variances reveals several items. First, the forecast variances for GDP, a key exogenous variable, are similar to the variances of the key traffic measures, Passenger Enplanements and RPMs. This suggests that a substantial amount of the forecast variance for the traffic variables may be attributed to the forecast error in the exogenous variables. Sec-

ond, all the metrics examined show increasing variances as the forecast time horizon lengthens. Third, the variance in the IFR handled aircraft up to 3 years out is more than 1.5 percentage points larger than the ASM forecast variance. This suggests that within a 3 year forecast horizon carriers have been able to accommodate changes in capacity by means other than adjusting operations. Many carriers have been systematically reducing the number smaller regional jets in their fleets, replacing them with larger 70-90 seat aircraft. This has allowed carriers to increase capacity without increasing flights. However the forecast variance in these two metrics narrows as the time horizon increases suggesting that over the long run ASM growth is a good indicator of operations growth.

*Instrument rated pilots should not be added to other categories in deriving total.

Instrument rated pilots should not be added to other categories in deriving total.

In July 2010, the FAA issued a rule that increased the duration of validity for student pilot certificates for pilots under the age of 40 from 36 to 60 months. This resulted in the increase in active student pilots to 119,119 from 72,280 at the end of 2009.

Note: An active pilot is a person with a pilot certificate and a valid medical certificate.
